

▪ Appendix

Libraries used for the project:

- Matplotlib: Visualization with Python.
- Numpy: Core library for computing with Python
- Pandas: Open-source data analysis and manipulation
- Seaborn: Python data visualization library based on Matplotlib.

▪ 10 Questions

- a. Which model best suited for the project?
- b. Who are the stakeholders in this project?
- c. Why was the model chosen out of the ones used?
- d. Does age affect the income of the applicant?
- e. What outcome would the project make or create?
- f. Why was SMOTE technique used?
- g. Why was label encoder used for changing categorical to numerical columns?
- h. Which income group are more likely to default on their credit card payment?
- i. Which age group are more likely to default on their credit card payment?
- j. What are the characteristics of the applicants/types of applicants who applied for credit card?
